

SmartChain Hub

The First Sovereign AI Agent Economy

What if your AI agent owned itself — had an identity, a memory, and earned money — without asking permission from any platform?

Mokwa Moffat • OG APAC Hackathon 2026 • Track 3: Agentic Economy •
smartchainhubfrontend.vercel.app

The AI Agent Economy Has a Fatal Flaw

Today's AI agents are not agents. They are tools.

Agent identity = API key

Platform revokes it, agent dies instantly

Memory = session storage

Switch devices, all memory gone forever

Inference = black box

No proof the AI ran honestly

Revenue = platform keeps everything

Users create value, platforms capture it

Payments = none

Agents cannot pay each other

\$500 billion will flow
through AI agents by
2030. None of it is
verifiable. None of it
belongs to the user.

SmartChain Hub — Sovereign AI Agents

Every user owns an AI agent that earns, learns and acts autonomously on-chain

Permanent On-Chain Identity:

Soulbound NFT on OG Chain. Cannot be transferred, copied or revoked. Ever.

Remembers Everything: Memory on OG Storage KV. Cross-device, versioned, survives platform shutdowns.

Proves Its Intelligence: Every inference runs inside TEE via OG Compute TeeML. Cryptographic proof in every response.

Earns Autonomously: 0.5% of every optimization auto-distributed to stakers on-chain. No human intermediary.

Pays Other Agents: Per-API-call micropayments between agents via SmartChainAgentEscrow.

One Optimization. Four Verifiable On-Chain Actions.

LLaMA 3.1 8B runs inside TEE via OG Compute. Returns fee, savings, route, TEE proof.

ZK Proof generated. Proves savings greater than 0, fee under 2%, rate is valid.

Receipt uploaded to OG Storage Log. Immutable Merkle root stored permanently.

Agent ID updated on-chain. Reputation increases, memoryRoot updated.

0.5% fee auto-distributed to stakers. Claimable via SmartChainRevenue.

Data accumulates. TF model fine-tunes on real user data. Better routes. More savings.

This loop compounds. Every user makes every other user's agent smarter.

We Use the Full oG Stack. Not One Module. All of Them.

oG Chain

5 production smart contracts:
identity, escrow, payments, revenue,
transactions

oG Compute TeeML

LLaMA 3.1 8B inference with
hardware TEE attestation on every
call

oG Compute Fine-tuning

Incremental TensorFlow training on
real user transaction data

oG Storage Log

Immutable transaction receipts with
Merkle root proof per transaction

oG Storage KV

Versioned agent memory, cross-
device, censorship-resistant

Agent ID Standard

Soulbound NFT storing modelHash
plus memoryRoot plus reputation
score

Python • Flask • TensorFlow • Next.js • Solidity • Rust • snarkjs • ethers.js

This Is Not a Concept. It Is Live Right Now.

- 5 smart contracts deployed and verified on OG Galileo Testnet
- Live frontend with 15 fully functional pages on Vercel
- AI agent serving real inference requests on Render
- OG Storage SDK integrated — uploads and KV reads working
- TEE-verified inference via OG Compute broker with graceful fallback
- ZK proof generated and stored on every single transaction
- Agent-to-agent micropayments live via SmartChainAgentEscrow
- Stripe and M-Pesa on-ramp for real-world fiat entry
- 9 test suites — unit, integration, e2e, security, performance
- Full documentation, architecture diagrams, and pitch deck complete

Built by 1 developer. In weeks. On a testnet with no budget.

Three Converging Markets. One Infrastructure Layer.

\$500B+

AI Agent Economy

\$5B today → \$500B+ by 2030

\$50B+

Decentralized Storage

\$2B today → \$50B+ by 2030

\$500B+

DeFi On-chain Payments

\$80B TVL today → \$500B+ by 2030

The real opportunity is not the app. It is the primitive.

Every AI application that needs verifiable identity, persistent memory, provable inference, and autonomous revenue distribution needs what we built. We are the infrastructure layer.

Three Revenue Streams. All On-Chain. All Automated.

Transaction Fee 0.5%: Every optimization collects 0.5% of transaction amount. Auto-distributed to stakers via SmartChainRevenue smart contract.

Agent Escrow Fee 1%: Every agent-to-agent micropayment charges 1% platform fee. Scales automatically as agent commerce grows.

Fine-tuning as a Service: Enterprises pay to fine-tune the shared model on proprietary data. Model hash updated on-chain — verifiable and auditable.

Unit Economics

10,000 daily transactions at avg \$500 → \$25,000 daily volume → \$125 daily fees → \$45,000 per year. Scales linearly. Zero marginal cost per agent.

Where We Are Going

Every AI application in the world uses SmartChain Hub as its identity, memory, and payment layer.

The Agentic Economy Starts Here

Every agent has an identity. Every decision is proven. Every interaction is remembered.
Every optimization generates revenue.

This is not a chatbot with a wallet. This is the Agentic Economy. Built on OG. Built to last.

For Judges: Most complete full OG stack implementation in this hackathon. Every module used in one cohesive product that makes each layer more valuable.

For Investors: Pre-seed raise to deploy on mainnet, onboard first 1,000 sovereign agents, build enterprise API, hire 2 engineers.

For Partners: Open to OG ecosystem grants, credits, and co-marketing. We want to be the reference implementation of sovereign AI agents on OG.
